

HoSys Hotel Management System - Progress Report After Dashboard Module

This report summarizes the work completed after the Dashboard module in the HoSys Hotel Management System backend project.

JWT Authentication

Implemented login and JWT token generation for secure authentication.

Role Based Access Control

Configured ADMIN, MANAGER, WAITER and CHEF role-based endpoint authorization.

Security Layer

Added SecurityConfig and JwtAuthenticationFilter with stateless security.

Dashboard Analytics

Created dashboard APIs for orders, tables, occupancy and revenue statistics.

Kitchen Workflow

Implemented order lifecycle management including PENDING, READY and COMPLETED states.

DTO Layer

Introduced DTOs to avoid exposing passwords and internal entity details.

Global Exception Handling

Created centralized exception handling with meaningful API responses.

Validation

Added request validation using @NotBlank, @Email and validation handlers.

Swagger OpenAPI

Integrated automatic API documentation and interactive testing.

Why We Moved From Thunder Client To Swagger

Thunder Client was useful for manual API testing during development. Swagger provides automatic API documentation, request/response models, browser-based testing, and serves as a professional API portal for frontend and backend integration.

Benefits of Swagger

- Automatic API documentation
- Interactive API testing
- Request and response schemas
- Better team collaboration
- Industry-standard API explorer

Project Flowchart
